For a figurative solution of a two-storied terminal of 100 m by 63 m in size, a stylized image of the Sichi is used – a Cossack boat (called «seagull»). The latter had a flat bottom and a raised nose on both sides, which allowed him to swim back and forth equally quickly. This has led to the use of cable-stayed structures for the roof of the building. Interior space is designed in a Ukrainian style: light color of walls; imitation of wooden beams on the ground floor, wooden logs – on the second, between which the fabric is stretched, natural light is visible everywhere, etc. The project envisages a reorganization of the master plan, incl. the station square, which should combine both, the existing and the new passenger terminals and provide a level of comfort for the area and create an integral composition of passenger terminal buildings.

Expected results and conclusions. The results of further research on modern practices and the possibilities of utilizing elements of folk culture and everyday life in the architecture of airport buildings are planned to be used in the educational process, during the development of project proposals, etc.

ARCHITECTURE OF THE AIRPORT HOTEL – A DISTINCTIVE BUSINESS CARD OF THE KHERSON REGION

The relevance of the topic. Ukraine has all the prerequisites for the tourism development. Convenient geographical position, favorable climate, diverse relief, a unique combination of natural and recreational resources, cultural and historical heritage, ramifications of the resort base – all these factors determine the competitive advantages of the country in offering a tourist product. A major role takes transportation connections with resort areas. Airports development was initiated due to the rapid progress of regions and urban areas.

Hotel provision services related to the air transportation is an integral part of modern enterprises. The development of the international airport «Kherson» is a part of the State target program for the airports development until 2023 (approved by the Cabinet of Ministers of Ukraine on February 24, 2016, №126). Among the perspective construction objects at the airport is a hotel with parking for servicing air passengers and guests of the city.

To create an expressive architectural style for five store hotel with 168 places was selected an ideation concept of the Kherson watermelon, which is one of the business cards for the region.

The combination of historical knowledge, architecture, the theory of structures, the technology of construction and design allowed to create a tolerant to the existing building architecture design and the space-planning solution.

Taking into account the station square organization peculiarities were developed schemes of transportation-pedestrian connections and a parking place for vehicles.
Expectation results and conclusions. The implementation of design solutions for the new hotel construction with a single-level parking will allow:
- to provide comfortable staying conditions for the air passengers and guests of the city;
- to create a building, will serve as a business card of the region due to its image.

THE INTERNALLY DISPLACED PERSONS HOUSING EXPERIENCE

Today Ukraine has faced a previously unknown for it problem – an increasing number of those internally displaced persons from the temporary occupied territories and the antiterrorist operation zone (eastern regions and Crimean peninsular). Unfortunately not enough attention is given to the providing housing for internally displaced persons, now there are only small positive changes may be seen. Famous architectures such as Shigeru Ban, Alehandro Aravena, had been designing housing for people deprived of their homes. But it is clearly not enough experience of solving such problems in Ukraine. That’s why the topic of the research remains relevant.

The results of the research showed, that not only our country has to take care of the share of internally displaced persons from the temporary occupied or beyond the state control territories. Syria, Georgia, Moldova, Azerbaijan and Armenia already have been solving the similar problems. Providing refugees with temporary or permanent housing is one of the main problems, which country faces during spontaneous or involuntary migration of the population. In this question, the experience of countries is similar and provides for the priority providing the displaced persons with temporary housing from available housing stock and their resettlement in the administrative building and specially created temporary settlements.

The other side of the problem of the internal displacement of the persons is their integration into the life of local communities, creating jobs for them, after all, using of their knowledge and skills to accelerate the development of the region that granted them asylum.

The considering of possibility of formation of modern cells of compact residence of entrepreneurs in the Transcarpathian region, who had lost their business in South and Eastern regions of Ukraine, but didn’t lost faith in their own strength and desire to work for the benefit of their families, for prosperity of the land, which became a new home for them, for the glory and power of our state, is planned in further research.
